scheduling
(parte II)

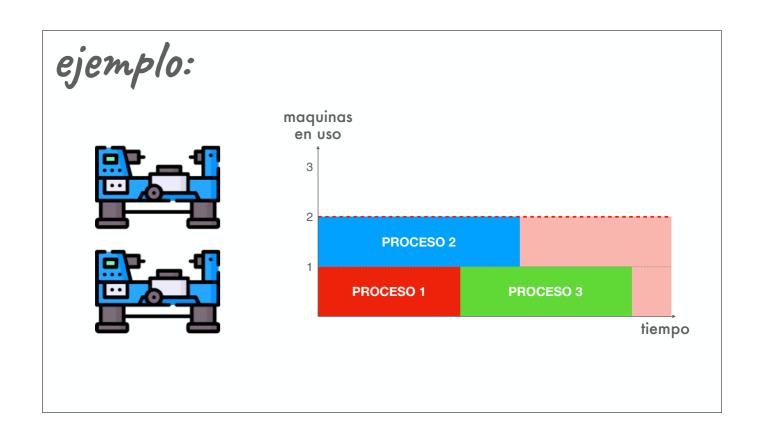

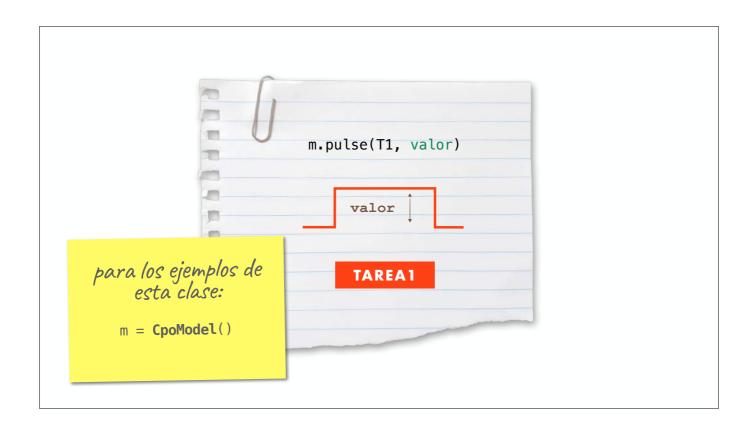

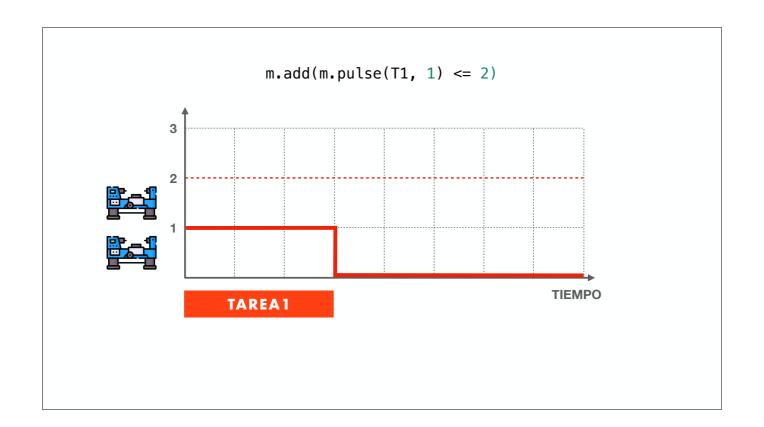

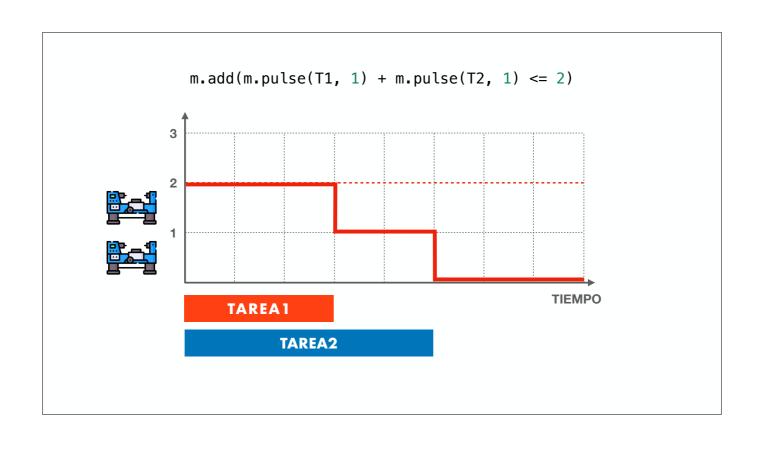

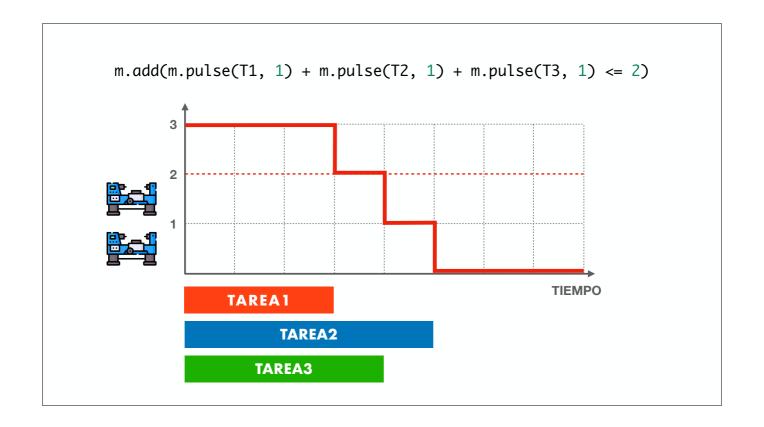

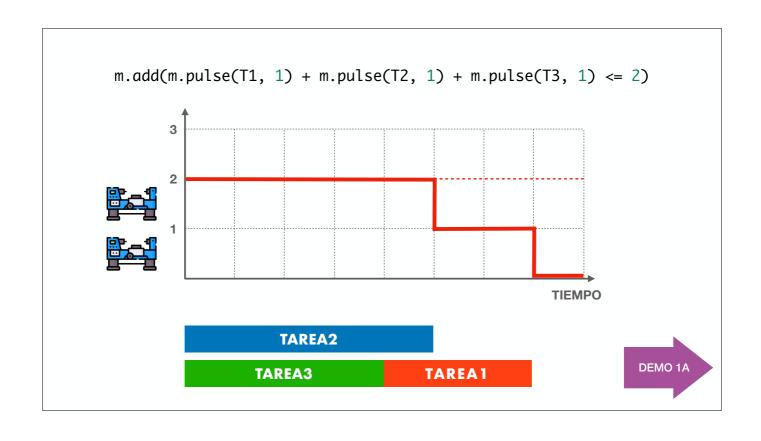

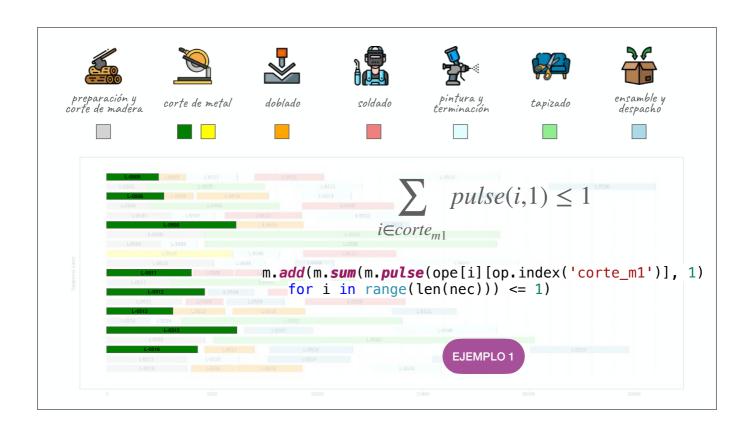

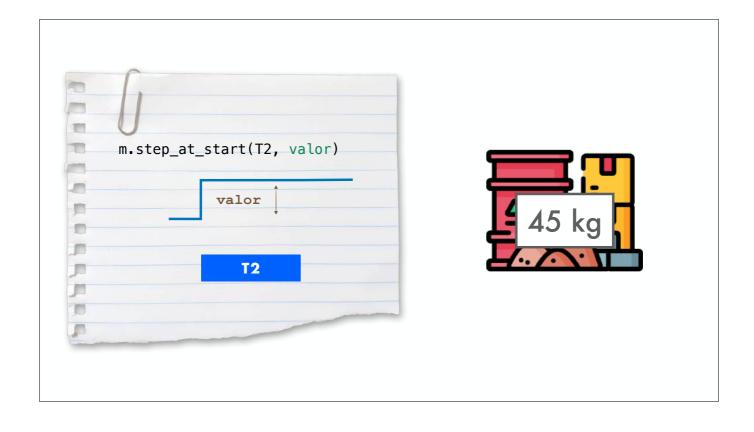

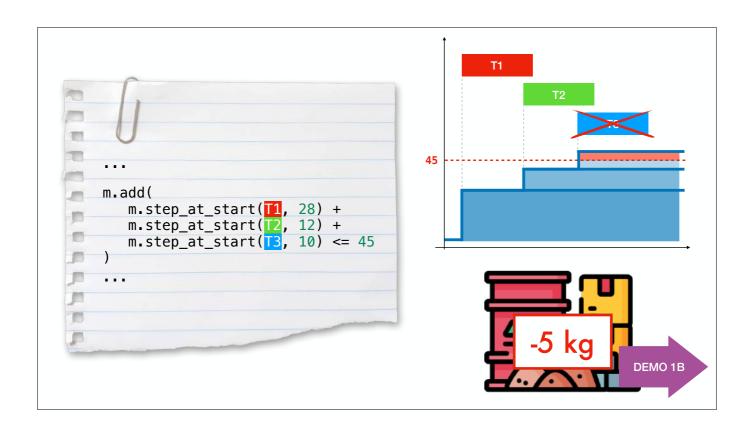

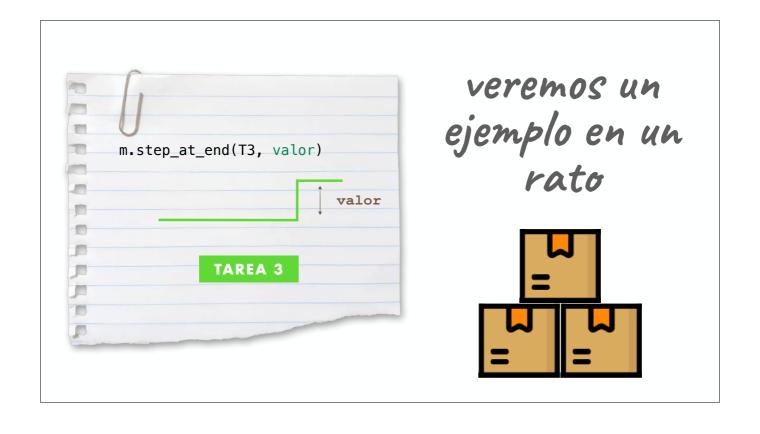

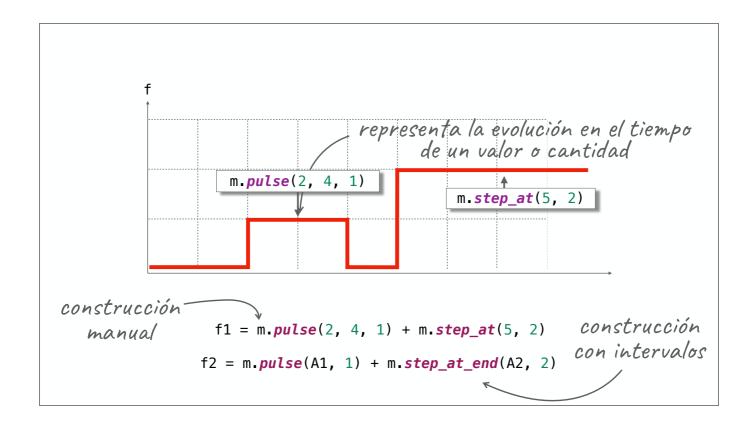

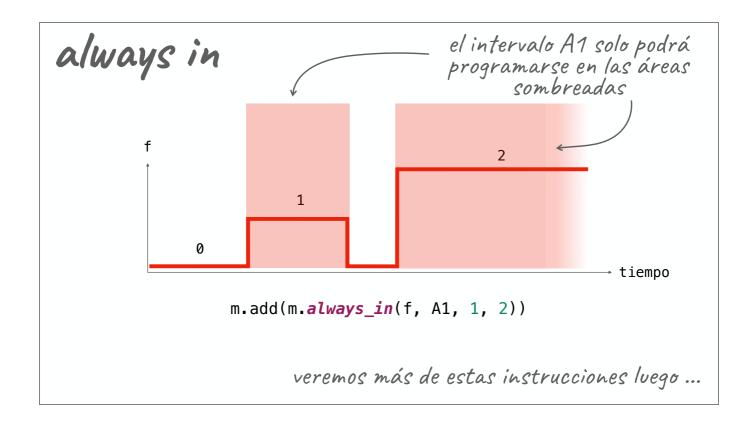

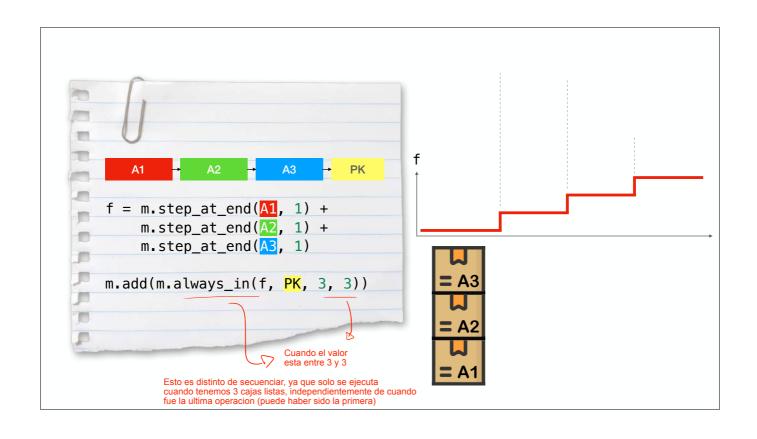

```
para graficar ...
                                         f = CpoStepFunction()
                                         f.add_value(0, 10, 20)
                                         f.add_value(10, 40, 40)
                                         f.add_value(40, 60, 40)
                                         visu.function(
      20
                                              segments = f,
                                              style = 'area',
                                              origin = 0,
                                              horizon = 30,
   para graficar debo
crear una función
                                              color = 'red')
                               60
        tipo step
                                                                 DEMO 1C
```

```
Como lo defino?

*Capacidad* ole gente no labura un finde)

dic = CpoStepFunction()

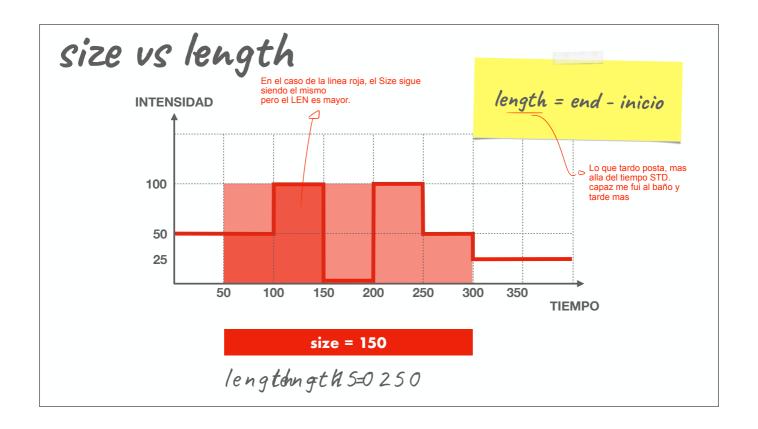

dic.set_value(0, 31, 100)

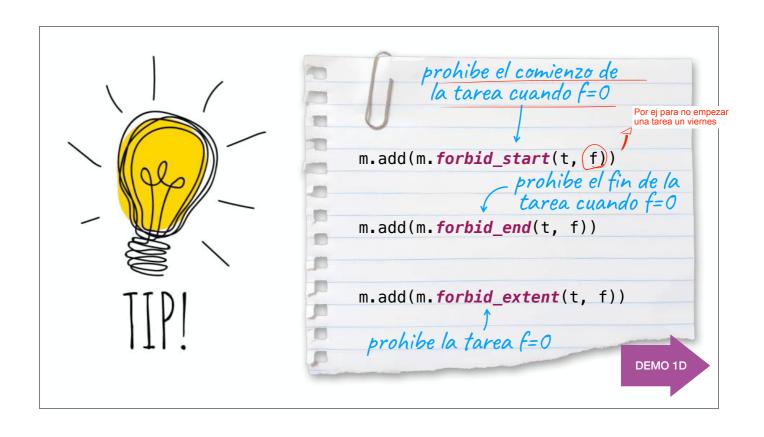

for i in range(0, 31, 7):
    dic.set_value(i, i+2, 0)

for i in [8, 25]:
    dic.set_value(i, i+1, 0)
```

```
t = m.interval_var(size=11 intensity=f,) name = 't')

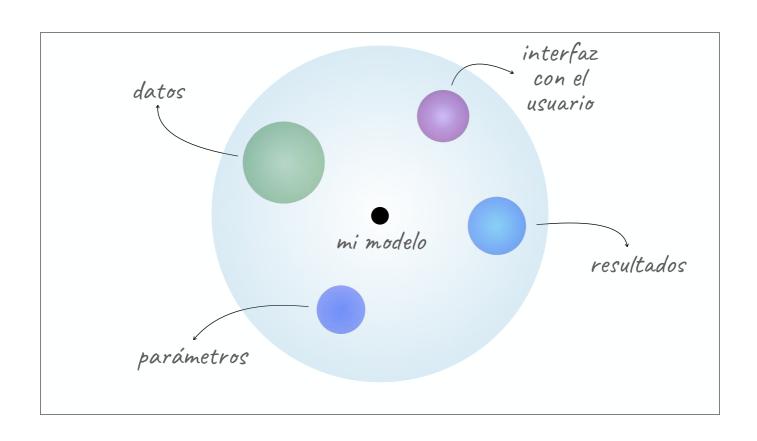

la tarea se realizará acorde
a la función f (en %)
```

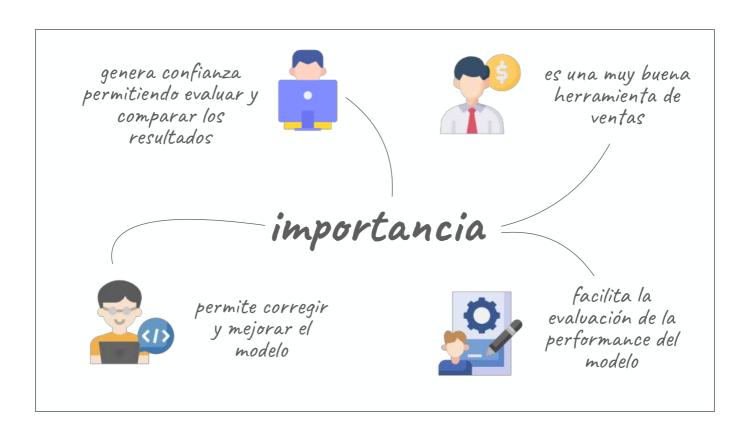

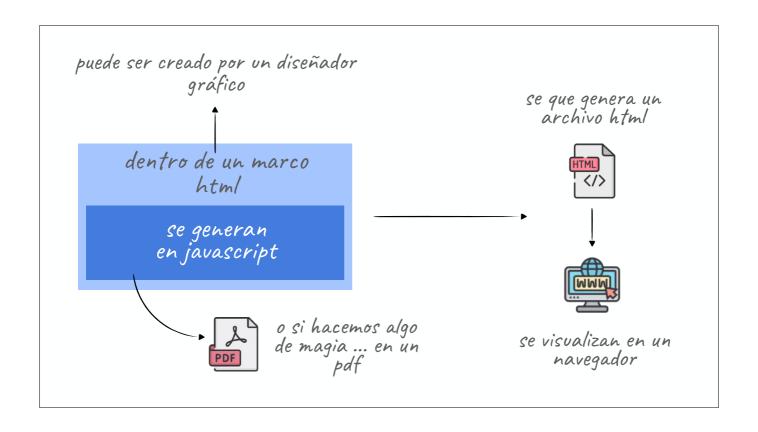

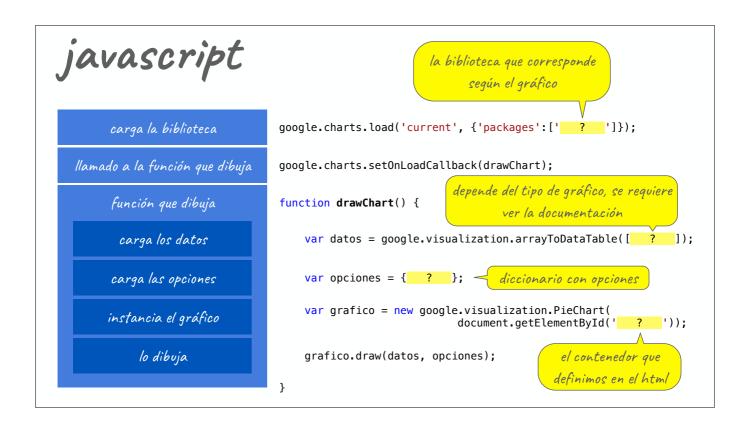

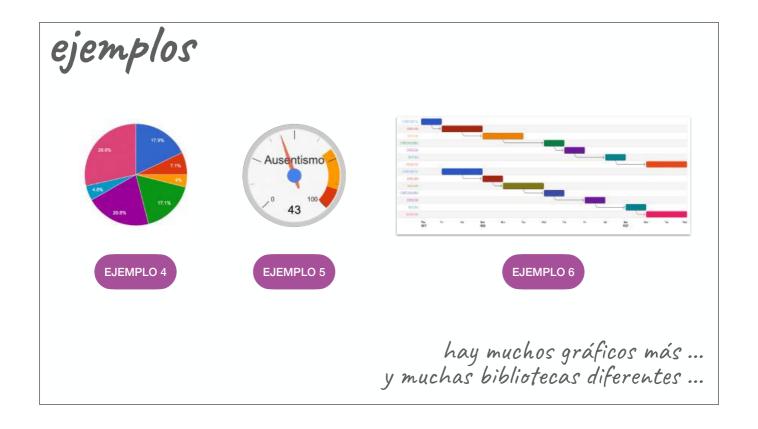

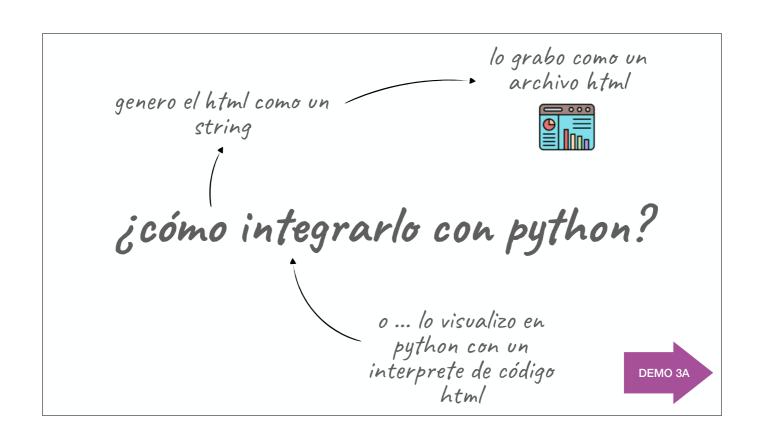

```
html (básico)
        encabezado (head)
                                      <html>

                                                        javascript
```

## pyhtml2pdf

```
import os
```

```
from pyhtml2pdf import converter

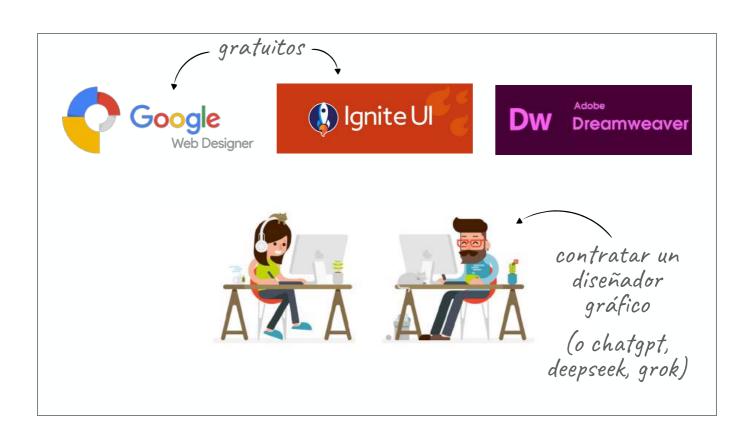

path = os.path.abspath('reporte.html')

converter.convert(f'file:///{path}', 'reporte.pdf')
```

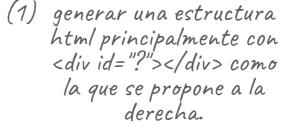

finalmente el diseño ...

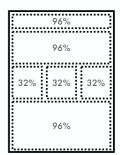

### algunas practicas optativas ...

tip: pueden pintar de diferentes colores los DIV para diferenciarlos

(2) probar cargar distintos gráficos en el html.

(3) incorporar todo a python y transformarlo a pdf.
